Subject: Letter of Interest in the BaaS.sh zero-knowledge verification module for gold-lot traceability on Stellar

Dear Mr Oleszkiewicz,

Natixar is a French deeptech company specialised in mineral traceability and verified carbon accounting. Its platform issues Verified Material Credentials (VMC), which link a material lot to its verified origin, chain of custody and carbon footprint, for clients in the mining, metals and raw-materials sectors.

In 2026, as part of the EU-LAC Digital Accelerator programme, Natixar ran a proof of concept with a gold mining operator in Guyana, covering carbon accounting and gold-lot traceability from mine to refinery. BaaS.sh contributed the blockchain anchoring layer of this proof of concept. The work confirmed a concrete need: operators must be able to prove where a gold lot comes from and that it meets agreed quality and compliance rules, without disclosing their suppliers, lab reports or commercial terms to every party in the chain.

We are therefore interested in the module BaaS.sh proposes to build on Stellar, in which a zero-knowledge proof establishes that a gold lot meets its provenance and quality rules, and a Soroban smart contract authorises the lot's next step while the underlying records stay private.

Subject to the module reaching a working testnet version, Natixar intends to:

- share the workflow requirements and the types of attestation used in gold traceability (origin, assay results, custody steps);
- test the module on Stellar testnet with anonymised or sample data;
- provide written feedback on usability and fit with field operations;
- assess, if the test is conclusive, a pilot deployment with one of Natixar's mining clients or prospects.

This letter expresses an interest only. It is not legally binding, creates no financial commitment or exclusivity for either party, and grants no right or licence over Natixar's specifications, data or methods. It is provided for BaaS.sh's discussions with Stellar.

Yours sincerely,

Svetlana Cranga
CEO, Natixar
